

IVMC

Integrated Vascular Management Clinic

The following are the Clinics within the IVMC

Chest Pain Fast Track Clinic – CPFT – Eligible patients are those who have suspected cardiac chest pain, but with no clear indication for immediate inpatient admission to hospital based on an emergency room assessment or clinical evaluation in another setting including Family Health Teams. An RN interviews, assesses, and plans the investigation in consultation with assigned vascular physician of the day or by established protocol. Each patient has an appropriate form of stress testing and other testing as required. Further treatment is determined based on the above. If there are no immediate cardiac concerns most patients will undergo a workup to look for vascular disease in other systems. Patients with high-risk findings at CPFT will be offered urgent cardiac catheterization.

Heart Function Clinic – Heart Failure – CHF is an increasing health problem in our aging society. Unfortunately, heart failure has a bad prognosis and survival rates are worse than in many forms of cancer. However, new therapies are helping improve this situation and carefully structured heart failure clinics provide a pathway to optimizing care. At KCC we have Nurse Experts who focus on this patient population and work with the vascular physicians to optimize all aspects of patient care. They also collaborate with our Nurse Experts in the Implanted Cardiac Device Clinic at KCC, since many of the patients with heart failure also require defibrillators, pacemakers and cardiac resynchronization devices. Heart failure referrals typically come from the Emergency Room, at hospital discharge and Family Health Teams.

Rapid Access Clinic – RAC – Eligible patients for the Rapid Access Clinic, are those with cardiac concerns that are not considered emergencies, but important to evaluate. These patients are often complaining of fainting, near faints, racing heart, atypical chest pain, shortness of breath without evidence of heart failure, or other complaints of unclear origin. The IVMC RN contacts

and triages each patient in consultation with the Cardiologist and organizes appropriate investigations.

Atrial Fibrillation Clinic – This is a special version of RAC. Due to the high risk for stroke and development of early dementia in atrial fibrillation patients who are not optimally managed, the nurses triage these patients on a priority basis.

Vascular Risk Optimization Clinic – VROC – Eligible patients are those with a risk factor profile for vascular disease requiring non-urgent vascular assessment and management. Our commitment is to manage the patient, including Cardiology consultation and to report to referring MD. The VROC allows the IVMC to manage Vascular Health and Disease at all stages of the continuum.

Post Stroke Management Clinic – This clinic is a special version of VROC tailored to patients with recent acute strokes whose stay in hospital is now over and they are ready to go home for further rehabilitation. Most patients in this clinic will undergo further investigation for vascular disease in other systems as well as optimization of existing risk factors.

These clinics combine to offer the health care providers and the people of our region, a varied means of timely access to cardiovascular care in the community. The level of service and expertise is reliable, innovative and greatly valued. Our nurses work closely with each patient to ensure understanding and comfort as they navigate their cardiovascular care.
